

Please provide a regulatory climate conducive to the proliferation of broadband. This will spur the high-tech & telecom industries, and provide an economic boost to the national economy. Why can't the biggest/best/most intelligent nation in the world lead the way in broadband installations? Many nations are wiring their people faster than the U.S., and at much cheaper prices. The key to the future of broadband is providing full-motion video with high QOS. This is crucial for video communication and e-commerce. There needs to be a government definition of broadband at a minimum of 750Kbps SYMMETRICAL service.

Sincerely,
Glenn Witherspoon
